In re: Patent application of  
Alan Gewirtz

Serial No.: 09/993,183

Filed: November 14, 2001

For: POST-TRANSCRIPTIONAL GENE SILENCING  
BY RNAi IN MAMMALIAN CELLS

Group Art Unit: 1635

Examiner: Jon B. Ashen

Conf. No. 6995

### Declaration of Dr. Alan M. Gewirtz for Earlier Date of Invention under 37 C.F.R. §1.131

Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Sir:

I, Alan M. Gewirtz, declare that:

1. I am the sole inventor of the invention disclosed and claimed in U.S. Patent Application Serial No. 09/993,183, including all subject matter disclosed and claimed therein.
2. I am a Professor of Internal Medicine and Pathology-Laboratory Medicine at the University of Pennsylvania School of Medicine, Division of Hematology/Oncology. The Experiment set forth in the patent application, and all related experiments, were conducted in my laboratory and under my direction at the University of Pennsylvania in the United States of America.
3. Prior to August 3, 2000, Gokdan Demir, MD, working under my direction, began a series of experiments with me, on the project reported in US Patent Application 09/993,183, first filed as Provisional Patent Application 60/248,346, filed November 14, 2000. I initially summarized the concept of the invention on the page reproduced at Tab 1 attached hereto, with dates redacted. All dates are similarly redacted on the attached exhibits. No other change was

Considered  
✓ D S  
8/30/06

made to the document before copying and attaching the pages hereto. If the Examiner wishes to see the actual, dated documents, Applicant can comply, and has the entire notebook in which the pages were recorded in date-sequence order.

4. Initially, reliable protocols were optimized for isolating total RNA and for preparing double-stranded RNA (dsRNA). The human c-kit gene target has been well characterized in the literature, and previously used in other experiments in human cells in the Gewirtz laboratory. Throughout the course of these experiments, spectrophotometric analyses were conducted in the laboratory of Dr. Stephen G. Emerson at the University of Pennsylvania.

5. To begin, a portion of the 5' end of c-Kit genomic cDNA was subcloned into expression vector pcDNA3 (containing T7 and SP6 promoters) by digesting with BamHI. See Tab 2 attached hereto. Using the c-Kit gene as a target, the effect of dsRNA on the expression of the c-kit receptor (KitR) was evaluated in CHP 100 neuroepithelioma (human melanoma) cells and HL-60 (human leukemia) cells, both of which were known to express KitR. See Tabs 3 and 4 attached hereto. Cell lines were maintained in RPMI 1640 media (GibcoBRL, Gaithersburg, Md.) containing 10% BCS. Varying amounts (150-350 µg/ml) of Kit dsRNA (KdsRNA) were added to the culture media. See Tabs 3, 4 and 6-10 attached hereto.

6. As a control, GFP dsRNA (GdsRNA) was added. See Tabs 5 and 6 attached hereto. As a control, 724 bp of Green Fluorescent Protein (GFP) cDNA was subcloned into pcDNA3 by digesting with EcoRI and HindIII.

7. Subcloned vectors were amplified in a chemically competent strain of E. coli DH5\_ cells. *In vitro* transcription reactions were carried out using known methods to linearize the plasmids using EcoRV and HindIII to synthesize the sense and corresponding antisense RNA strands, respectively. Digested plasmids were treated with Proteinase K to inactive any RNases, and purified as a template for transcription by commercial methods. RNA polymerases were from Promega. The products were pooled and annealed for 10 minutes at 90°C, 10 minutes at 4°C, and 2 hours at 40°C in a hybridization mixture containing NaCl 250 mM, Tris HCl 40 mM at pH 7.5 and EDTA 5 mM in RNase free water. The dsRNA was eluted using diethyl pyrocarbonate treated H<sub>2</sub>O, and the integrity of the dsRNA was confirmed by running a 1% agarose gel in TBE 1X (90 mM Tris-borate/2 mM EDTA pH 8.0). It was then purified by column chromatography. See Tabs 6-7 attached hereto. See also, for example, the pages at Tab

8 showing an agarose gel showing the affect of dsRNA on c-Kit receptor signaling in HL-60 cells.

8. Cells were incubated under the same conditions, at 37°C., in 5% CO<sub>2</sub> for 1-4 days. See Tabs 8-10 attached hereto. At the end of the incubation period, FACS analyses were performed as described in the specification. Although no effect on KitR expression was observed until day 3, then inhibition was seen as disclosed in the specification, although only in the cells exposed to the KdsRNA. HL-60 cells behaved differently as shown at Tab 9, and as disclosed in the specification from CHP 100 cells, in both cases the KitR expression was unaffected by comparable doses of GdsRNA.

9. The foregoing experiment (actually a series of experiments) demonstrated for the first time that it is possible to disrupt gene expression at the mRNA level in a mammalian target gene in a *human* cell by providing to that human cell, interfering dsRNA (dsRNA) guide sequences that are homologous to a portion of the target gene, such that RNA interference (RNAi) of the target gene is induced. For example as shown, KitR expression was significantly reduced in human cancer cells treated with c-Kit dsRNA, but no reduction in KitR expression was seen upon treatment of the cells with GdsRNA. If the inhibition of KitR expression upon administration of c-Kit dsRNA had been due to a general inhibition of translation via the PKR response, then a similar reduction in KitR expression would have been induced by the GFP dsRNA. However, since KitR expression was reduced only upon administration of the target specific c-Kit dsRNA, the inhibition of KitR expression was necessarily due to gene-specific gene silencing (disrupted expression) as a result of the introduced dsRNA. Thus, the present specification, in describing and enabling the claimed invention, demonstrates the feasibility of inducing gene-specific RNAi in human cells with dsRNA, without apparent interference from the PKR response or other defenses.

10. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the above-identified application or any patents issued thereon.

Respectfully submitted,

A handwritten signature in black ink, appearing to read 'Alan M. Gewirtz', written over a horizontal line.

Date: April 28, 2006

Alan M. Gewirtz

1) C-KIT mRNA (cDNA) - FULL LENGTH CLONED INTO pCDNA3. →  $\Rightarrow$  RNA TRANSCRIPTS
